I know this is probably longer than hoped, but it captures the minimum risk info of multiple areas of investigation per each the north and south impoundments and multiple receptors for each. It might could be shortened a hair with tweeking. It could also be shortened a lot if we totally left out groups where they deemed no risk (i.e., only refer to "all other areas" there was no risk & leave them to the longer version).

I did not include the incremental risk or brief discussion comparing to after the TCRA. There are statements that those things were done, but I'll have them in the longer version.

I also still have to fill in specifically which tables to use, unless you'd rather have table references only in the longer version.

Phil
